At the 10 July online briefing, the following topics were discussed:

1. The group discussed the problems of getting the Railways back to sustainable passenger numbers and services. UK passengers do not have a clear idea about wearing masks and distancing due to confusing information. In Hong Kong this problem has been overcome and mask wearing is normal.

2. The group talked about the possible contributions of CFD in modelling air flows in building and other spaces. Classroom simulations would be useful. It was pointed out that natural ventilation is good but many buildings do not have this option and have to use mechanical ventilation.

3. CIBSE representatives were welcomed to the meeting. The Chair emphasised that what is most urgently needed is existing solutions that can be implemented quickly.

It was agreed that discussions will now move to detailed discussion groups covering the following topics:

- Masks
- Buildings
- Mass Transport
- Airlines
- Railways
- Manufacturing/Management
- CFD

The next group meeting will be on 31 July.
